## The “Green” Story of Wooden Light Standards

Here are six key attributes which make wood light poles the “green” choice for outdoor lighting.

- Wood enhances the beauty of any environment.
- Wood light poles are made from plentiful, renewable resources.
- Energy requirements for manufacturing wood light poles are low.
- Use of wood helps limit greenhouse gases.
- Wood is recyclable.
- Carbon Sequestration: Treating wood used for light standards seals in the carbon that exits when trees are harvested or die naturally.

No product is without environmental impact, but wood poles come close. They are made from plentiful and renewable resources grown on managed timberlands. Energy requirements are low; nature generates most of the energy required. Carbon Sequestration: Growing trees produce oxygen and wood stores carbon; treating wood poles seals in the carbon and helps limit the accumulation of greenhouse gases.

And used poles are recyclable for a variety of applications.
